Certificate

This is to certify that the project entitled “**Radar System ”** has been successfully completed by Mr Dinesh Solanki, Mr Euhid Aman, Mr Faisal Khan and Mr K N Monish Kumar of Sixth semester B.Tech at **Presidency University. Bengaluru,** as the Internet Of Things project in partial fulfilment for the award of B.Tech Degree course conducted by the Presidency University. The Project Report presented here is the bonafide work of the student.

Guide:

Prof. Riyazulla Rahman J
Assistant Professor-G1

Head of the Department

Dr. C. Kalairasan
Associate Dean (CSE)

Group Members:

ID	**NAME**
20171CSE0133	Dinesh Solanki G
20171CSE0146	Euhid Aman
20171CSE0147	Faisal Khan
20171CSE0772	K N Monish Kumar

Acknowledgement

While performing our project, we had to take the help and guidelines of some respected persons who deserve our greatest gratitude. The completion of this project gave us immense pleasure.

We are highly indebted to Dr. Mohan K.G, Mr. Afroz Pasha sir,for their guidance, constant supervision and for their support in completing our project.

We would like to express our gratitude to our parents for their kind co-operation and encouragement.

ABSTRACT

In this paper a low cost and user friendly Radar system is presented using Arduino uno, ultrasonic Sensor, servo motor and an ESP wifi module. This system can be used to easily detect any kind of object in it's vicinity, and pass the object detection message to the connected mobile system.

This paper also describes the hardware and software architecture of system, future work and scope. The proposed prototype of radar system is implemented and tested on hardware and it gave the exact and expected results.

Table of Contents

COMPONENTS USED

1. Arduino Uno
2. BreadBoard
3. Servo Motor
4. Ultrasonic Sensor
5. Jumper wires
6. ESP Wifi Module
7. USB Cable

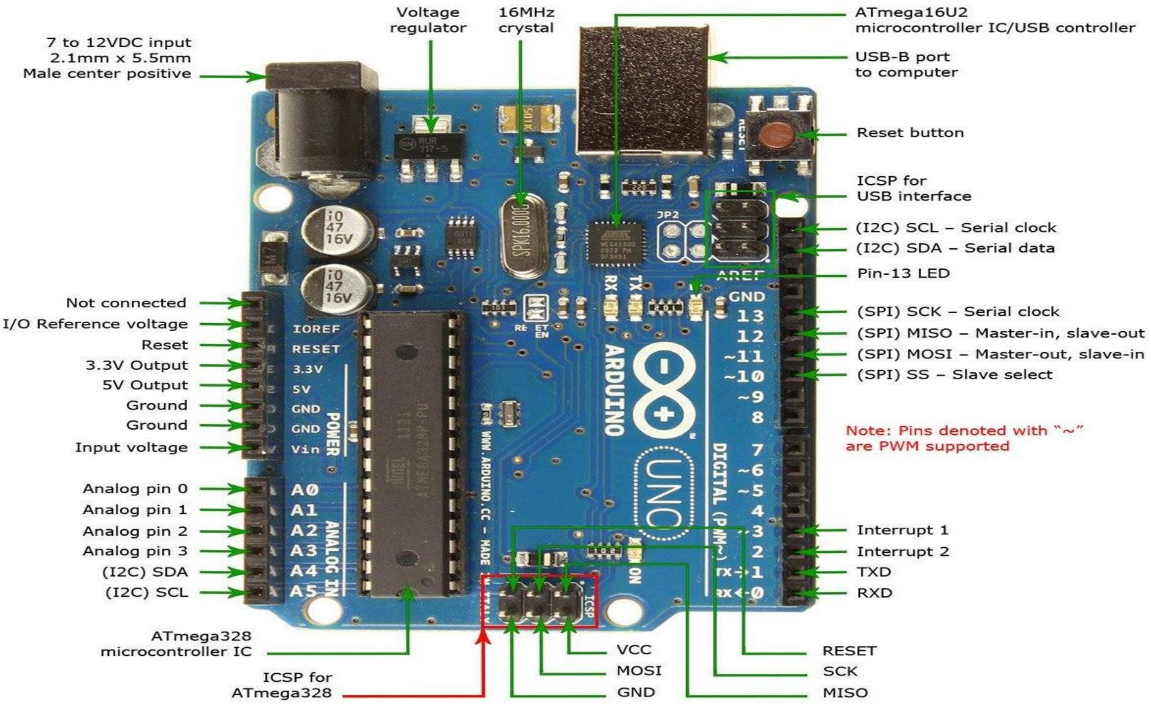
FEATURE OF COMPONENTS USED

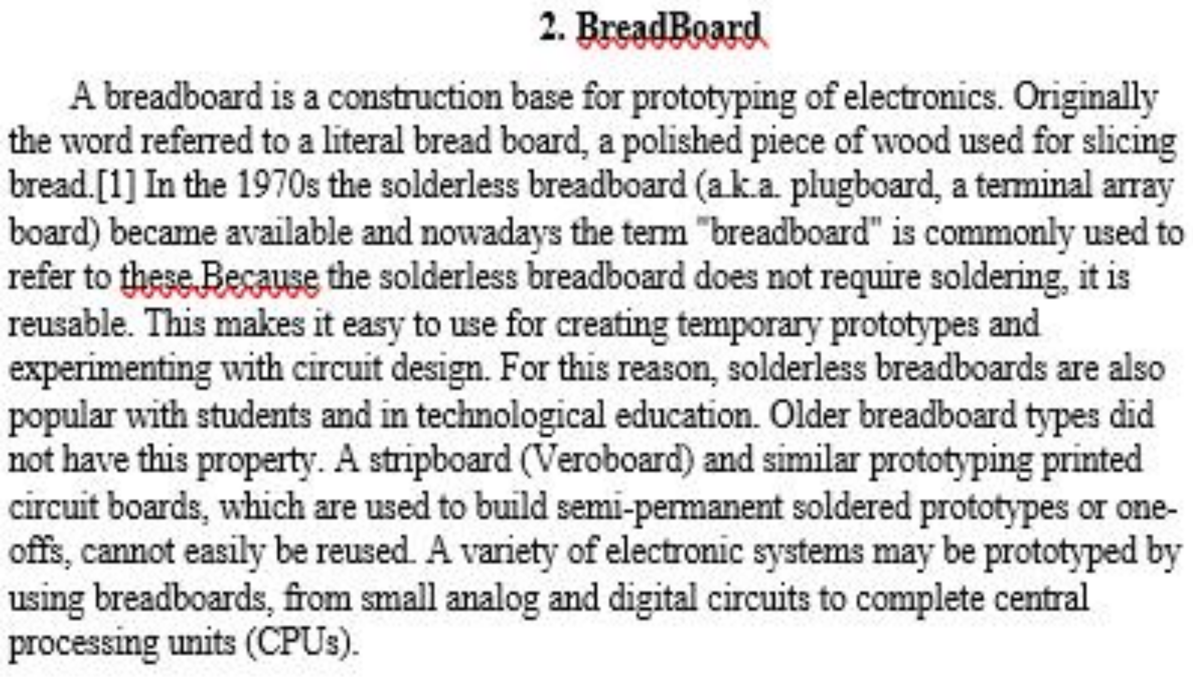
1.Arduino Board

Arduino is a prototype platform (open-source) based on an easy-to-use hardware and software. It consists of a circuit board, which can be programed (referred to as a microcontroller) and a ready-made software called Arduino IDE (Integrated Development Environment), which is used to write and upload the computer code to the physical board.

Arduino provides a standard form factor that breaks the functions of the micro-controller into a more accessible package.

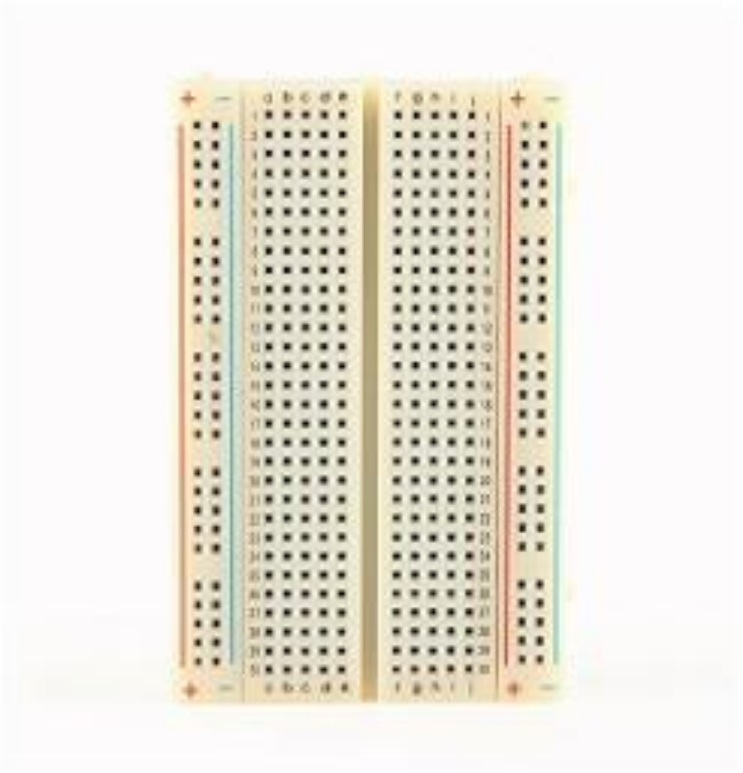
Arduino Pin Out Diagram





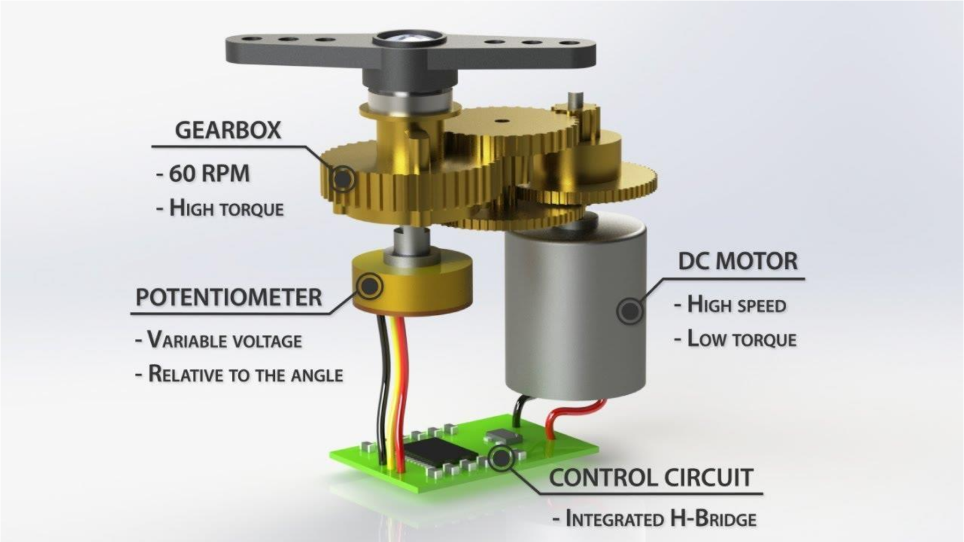
2. BreadBoard

A breadboard is a construction base for prototyping of electronics. Originally the word referred to a literal bread board, a polished piece of wood used for slicing bread.[1] In the 1970s the solderless breadboard (a.k.a. plugboard, a terminal array board) became available and nowadays the term "breadboard" is commonly used to refer to these.Because the solderless breadboard does not require soldering, it is reusable. This makes it easy to use for creating temporary prototypes and experimenting with circuit design. For this reason, solderless breadboards are also popular with students and in technological education. Older breadboard types did not have this property. A stripboard (Veroboard) and similar prototyping printed circuit boards, which are used to build semi-permanent soldered prototypes or one-offs, cannot easily be reused. A variety of electronic systems may be prototyped by using breadboards, from small analog and digital circuits to complete central processing units (CPUs).



3.Servo-Motor

A servo motor is a type of motor that can rotate with great precision. Normally this type of motor consists of a control circuit that provides feedback on the current position of the motor shaft, this feedback allows the servo motors to rotate with great precision. If you want to rotate an object at some specific angles or distance, then you use a servo motor. It is just made up of a simple motor which runs through a servo mechanism.



4. Ultrasonic Sensor

An ultrasonic sensor is an electronic device that measures the distance of a target object by emitting ultrasonic sound waves, and converts the reflected sound into an electrical signal.

5. Jumper Wires

A jump **wire** (also known as **jumper wire**, or **jumper**) is an electrical **wire**, or group of them in a cable, with a connector or pin at each end (or sometimes without them – simply "tinned"), which is normally **used** to interconnect the components of a breadboard or other prototype or test circuit, internally or with other

Male to Male Jumper Wires

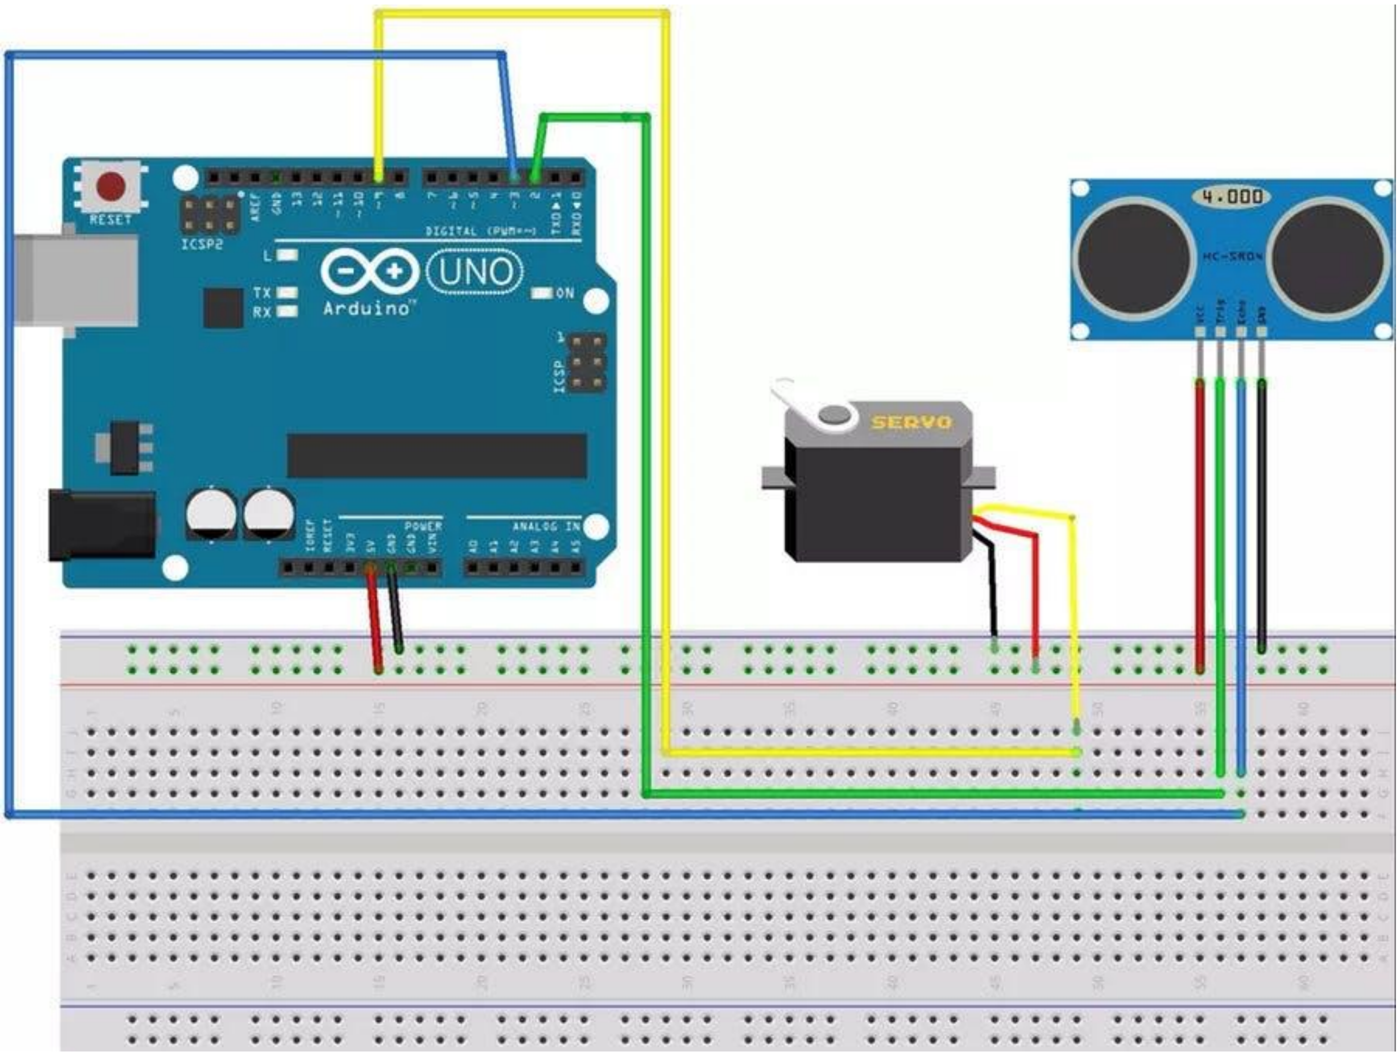
Female to Female Jumper Wires

Male to Female Jumper Wires

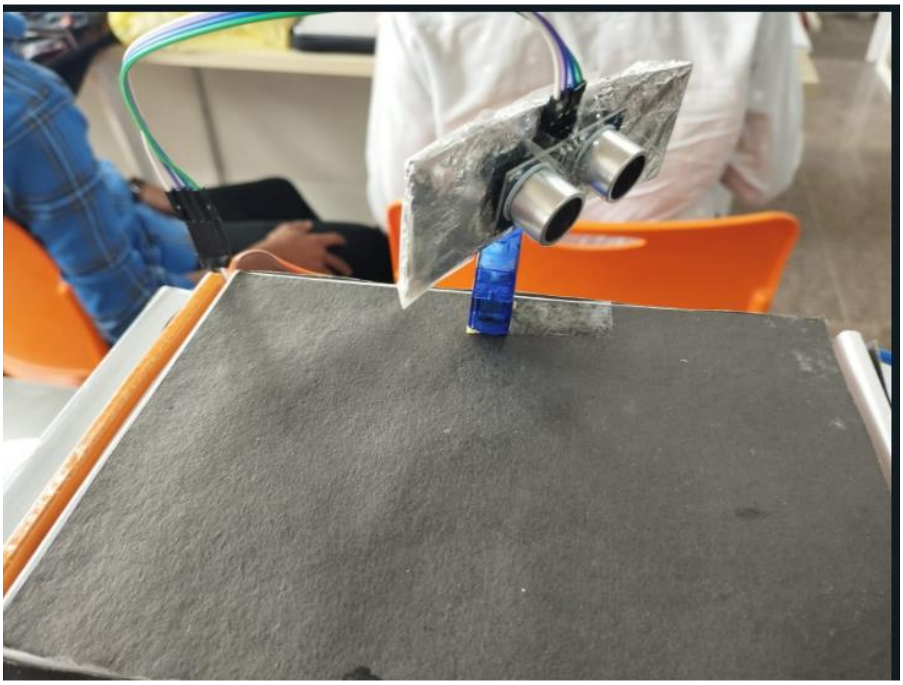
6. USB Cable

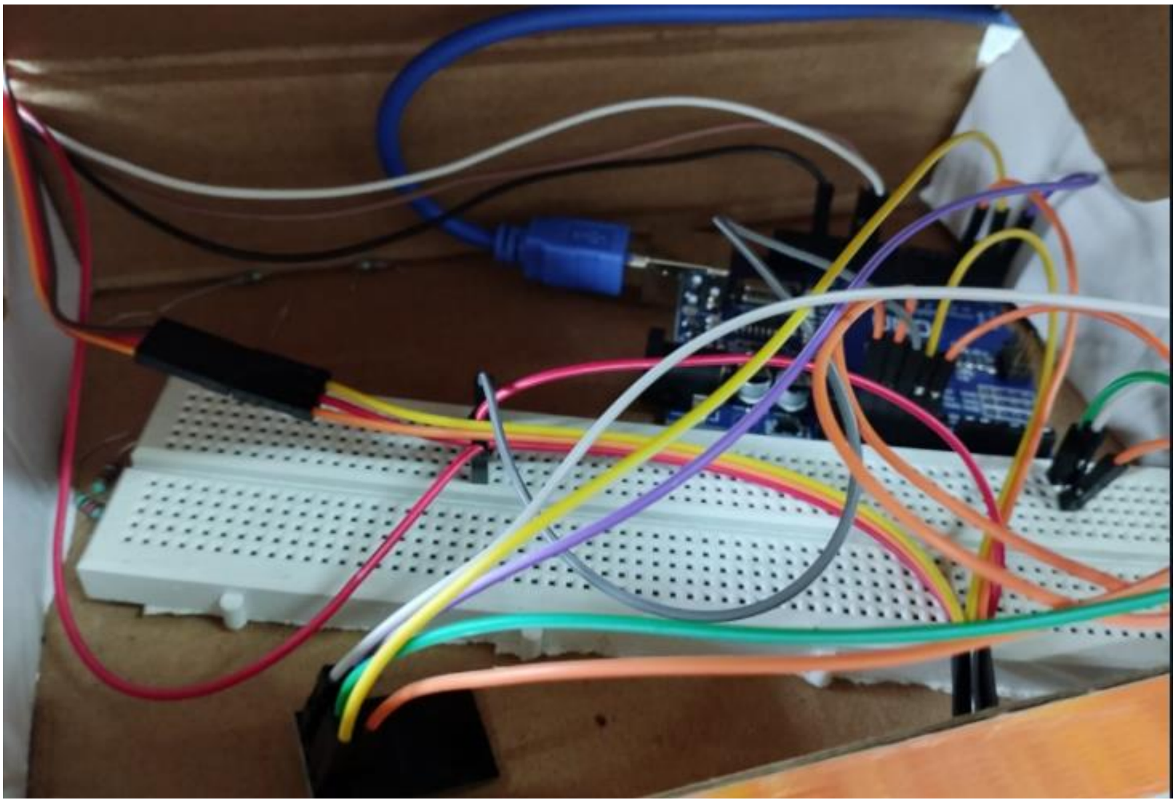
The term USB stands for "Universal Serial Bus". USB cable assemblies are some of the most popular cable types available, used mostly to connect computers to peripheral devices such as cameras, camcorders, printers, scanners, and more.

PIN OUT DIAGRAM



Manual connection of the project :





Code :

```
// Includes the Servo library
#include <Servo.h>
// Defines Tirg and Echo pins of the Ultrasonic Sensor
const int trigPin = 10;
const int echoPin = 11;
// Variables for the duration and the distance
long duration;
int distance;
Servo myServo; // Creates a servo object for controlling the servo motor
void setup() {
  pinMode(trigPin, OUTPUT); // Sets the trigPin as an Output
  pinMode(echoPin, INPUT); // Sets the echoPin as an Input
  Serial.begin(9600);
  myServo.attach(3); // Defines on which pin is the servo motor attached
}
void loop() {
  // rotates the servo motor from 15 to 165 degrees
  for(int i=15;i<=165;i++){
  myServo.write(i);
  delay(30);
  distance = calculateDistance();// Calls a function for calculating the distance measured by the Ultrasonic sensor for each degree

  Serial.print(i); // Sends the current degree into the Serial Port
  Serial.print(","); // Sends addition character right next to the previous value needed later in the Processing IDE for indexing
  Serial.print(distance); // Sends the distance value into the Serial Port
  Serial.print("."); // Sends addition character right next to the previous value needed later in the Processing IDE for indexing
  }
  // Repeats the previous lines from 165 to 15 degrees
  for(int i=165;i>15;i--){
  myServo.write(i);
  delay(30);
  distance = calculateDistance();
  Serial.print(i);
  Serial.print(",");
  Serial.print(distance);
  Serial.print(".");
  }
}
// Function for calculating the distance measured by the Ultrasonic sensor
int calculateDistance(){

  digitalWrite(trigPin, LOW);
  delayMicroseconds(2);
  // Sets the trigPin on HIGH state for 10 micro seconds
  digitalWrite(trigPin, HIGH);
  delayMicroseconds(10);
  digitalWrite(trigPin, LOW);
  duration = pulseIn(echoPin, HIGH); // Reads the echoPin, returns the sound wave travel time in microseconds
  distance= duration*0.034/2;
  return distance;
}
```

Processing code :

```
import processing.serial.*; // imports library for serial communication
import java.awt.event.KeyEvent; // imports library for reading the data from the serial port
import java.io.IOException;
Serial myPort; // defines Object Serial
// defubes variables
String angle="";
String distance="";
String data="";
String noObject;
float pixsDistance;
int iAngle, iDistance;
int index1=0;
int index2=0;
PFont orcFont;
void setup() {

 size (1200, 700); // ***CHANGE THIS TO YOUR SCREEN RESOLUTION***
 smooth();
 myPort = new Serial(this,"COM9", 9600); // starts the serial communication
 myPort.bufferUntil('.'); // reads the data from the serial port up to the character '.'. So actually it reads this:
angle,distance.
}

```

README

1) First give the power supply to the Arduino board

2) The ultrasonic and servo motor is connected

3) Waits for the sensor

4) Sevro motor will be in action

5) Senses any object

6) Through serial the data is fetched by processing ide

CONCLUSION

Through this project we came across various components which gave us more insight about the subject “Internet Of Things”. Our project was about Radar System using Arduino

This objective of our project is to provide the improvement on our current Air and Water defense systems, and for our better protection.This is the main objective of our project.
